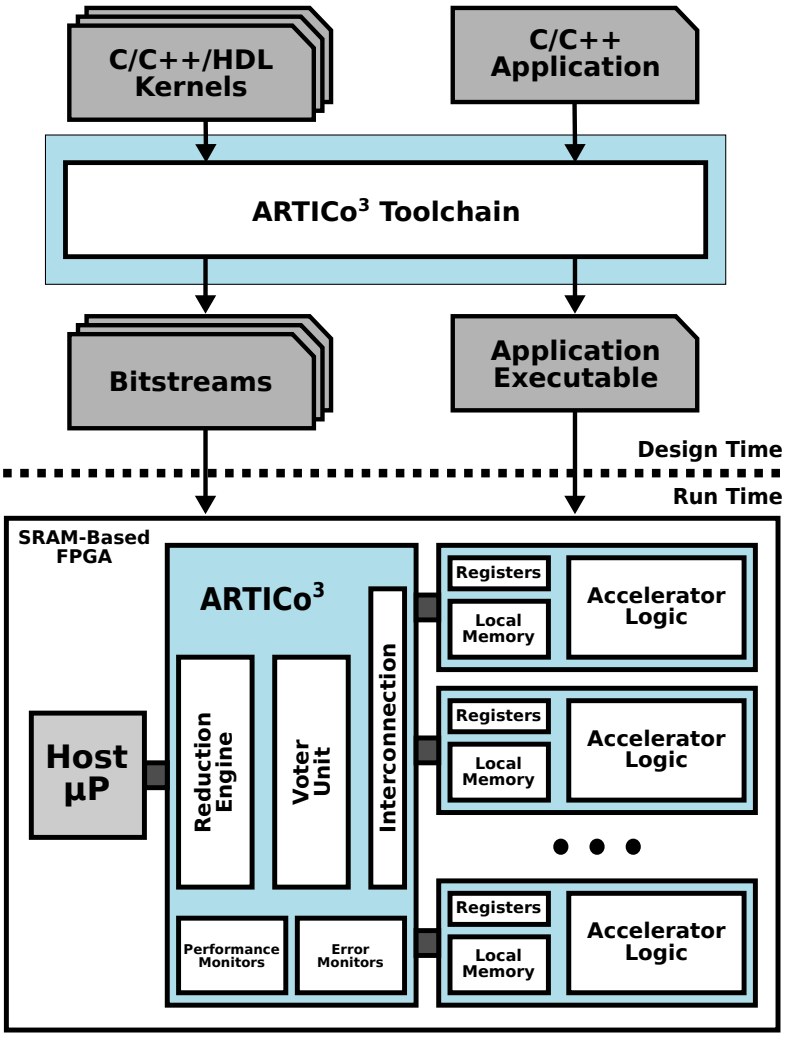
ARTICo³ is an **open-source runtime reconfigurable processing architecture** to enable **hardware-accelerated** high-performance embedded computing. It is highly flexible, offering **adaptive** computing **performance**, **energy efficiency**, and **fault tolerance** on demand.

The architecture is complemented at **design time** with an **automated toolchain** to build reconfigurable multi-accelerator systems, and at **run time** with a **software library** to transparently manage both reconfiguration and parallel execution processes.



Main Features

Hardware Design made easy

Write your accelerators in C/C++ and exploit High-Level Synthesis.

FPGA Reconfiguration made easy

Forget about complex design flows and low-level technology limitations.

Parallel Processing made easy

Offload computations to the FPGA fabric transparently using a lightweight API.

Open Source Framework

ARTICo³ is an **open-source** framework available on GitHub. **Documentation** and **tutorials** are also available online for you to use it in your own projects.

ARTICo³ is supported by an increasing **community** of developers in the field of **reconfigurable embedded systems**.
